

POCKETSMART AI: TEAM INVOLVEMENT IN DEMONSTRATION

1. Collaborative Demonstration Philosophy

The successful development and demonstration of PocketSmart AI was achieved through cross-functional teamwork. Responsibilities were distributed across system architecture, AI integration, backend engineering, user experience design, and quality assurance.

2. Team Role Allocation Matrix

TEAM RESPONSIBILITY DISTRIBUTION MATRIX	
• System Architect & Project Lead	Architecture & Auth Flow
• Backend & Security Engineer	FastAPI & JWT Management
• AI & Algorithmic Specialist	Gemini AI & Fallback
• Frontend & UX Designer	Jinja2 & Bootstrap 5 UI
• QA & Demonstration Coordinator	Testing & Video Script

Role 1: System Architect & Project Lead

- **Demonstration Contribution:** Delivered the project introduction, articulated problem statements, and explained the high-level decoupled architecture connecting the ASGI gateway to downstream services.

Role 2: Backend & Security Engineer

- **Demonstration Contribution:** Demonstrated the dynamic user registration (/register) and login pipeline (/login, /token), explaining Bcrypt password hashing and JWT cookie session management.

Role 3: AI & Algorithmic Integration Specialist

- **Demonstration Contribution:** Presented the core AI budgeting workflows across Home, Party, and Jewelry planners. Explained prompt structure and demonstrated the 1.2 ms heuristic fallback engine during simulated network loss.

Role 4: Frontend & UX Designer

- **Demonstration Contribution:** Showcased user interface responsiveness, Jinja2 template rendering, dynamic card animations, and one-click e-commerce redirection buttons.

Role 5: QA & Demonstration Coordinator

- **Demonstration Contribution:** Curated standardized input parameters, validated terminal logs for 200 OK status codes,

managed demo recording software, and organized the final submission package.

3. Team Coordination & Rehearsal Schedule

- **Rehearsal Phase 1:** Dry run of all 3 planners to verify input schemas and eliminate form validation errors.
- **Rehearsal Phase 2:** Latency checks verifying sub-second response times across all endpoints.
- **Final Recording Phase:** Coordinated execution of the complete user journey, resulting in the final demonstration recording
